Folder Structure

1. Node Modules :

- ❑ Purpose: This folder contains all the dependencies and packages your project needs.
- ❑ Generated by: npm install
- ❑ Tip: Don't touch this manually; it's auto-managed. It's excluded using .gitignore.

2. Public :

- ❑ Purpose: Contains static files that do not go through the Vite build process.
- ❑ Example: vite.svg — a default logo provided by Vite.
- ❑ Use Case: Place public assets like logos, favicon, etc. here.
- ❑ Access: Use them with /vite.svg in your code.

3. Src (Source) :

This is the main folder where your React application lives.

- ❑ **Assets**  : Stores images, logos, icons, etc.
- ❑ **App.jsx** : This is the heart of your app, the main component. You write your app's UI logic here. Used inside: main.jsx
- ❑ **App.css** : Styles for App.jsx. Helps you separate logic and design.
- ❑ **index.css** : Global styles for your whole application.
- ❑ **main.jsx** : Entry point for React app. Renders App.jsx into the DOM.

4. .gitignore :

- ❑ Purpose: Tells Git which files/folders to ignore (like node_modules, .env etc.)

5. eslint.config.js :

- ❑ ESLint helps catch errors and enforce code style.
- ❑ This config file defines rules and plugins.

6. index.html :

- ❑ Main HTML file that Vite uses as a template.
- ❑ Contains: `<div id="root"></div>` where React mounts.

7. package.json

- ❑ Very important: It describes your project.
- ❑ Contains:
 - Project name, version
 - Scripts (dev, build, etc.)
 - Dependencies

8. package-lock.json

- ❑ Auto-generated by npm.
- ❑ Locks exact versions of dependencies to ensure consistency.

9. README.md :

- ❑ Markdown file for project description.
- ❑ You can write instructions, tech used, and how to run the project.

10. vite.config.js

- ❑ Configuration file for Vite.
- ❑ Used to add plugins, change default settings like aliases, server ports, etc.
