CSS In React

❑ Regular CSS File : If you import a CSS file in React (like App.css), those styles are global by default.

❑ CSS Modules: Lets you scope CSS to a component (no global conflicts).

❑ Inline CSS: You use the style prop, which takes a JavaScript object (not a string).

Regular CSS File

```js
// App.js
import './App.css';

function App() {
  return <h1 className="title">Hello React</h1>;
}
```

```css
/* App.css */
.title {
  color: blue;
  font-size: 30px;
}
```

CSS Modules:

```js
// Button.js
import styles from './Button.module.css';

function Button() {
  return <button className={styles.btn}>Click Me</button>;
}
```

```css
/* Button.module.css */
.btn {
  background: green;
  color: white;
  padding: 10px;
}
```

Inline CSS:

```
function App() {
  return (
    <h1
      style={{
        color: 'red',
        fontSize: '24px'
      }}
    >
      Hello Inline
    </h1>
  )
}
```
